Lab 5

Andrew Hopkins CM: 1164

1. Test driven development is the process of writing a single test for a function and then writing the code that will pass that test without breaking any of the other tests.
2. I believe that test driven development is a very useful development process that can improve the quality of code. However there are some projects or functions that I believe are not appropriate for test driven development, such as GUI's.
3. Test driven development is nice since it breaks up the problem into smaller easier to solve pieces. However having to commit each change to git slowed the process down.
